PHASE 1 – BRAINSTORMING & IDEATION

1.1 Problem Identification

In ServiceNow Incident Management, manually controlling form fields can make incident handling less efficient. Certain fields may need to become mandatory, hidden, read-only, or change automatically based on the user's input.

To improve the incident form, Client Scripts and UI Policies can be used to control the form dynamically and provide a better user experience.

1.2 Problem Statement

The Incident form should automatically respond to user actions and field values. Without proper form controls, users may enter incomplete or unnecessary information, which can affect the accuracy and consistency of incident records.

1.3 Proposed Solution

The proposed solution is to implement **Client Scripts and UI Policies** on the ServiceNow Incident form.

- **Client Script** will be used to perform client-side actions when a field changes or when the form loads.
- **UI Policy** will be used to dynamically make fields mandatory, visible, or read-only based on specific conditions.
- These controls will help users enter the required information correctly.

1.4 Objectives

1. Improve the usability of the Incident form.
2. Automatically control fields based on conditions.
3. Make required fields mandatory when necessary.
4. Hide or display fields according to incident requirements.
5. Make selected fields read-only when required.
6. Reduce incorrect or incomplete incident information.
7. Improve the efficiency of Incident Management.

1.5 Target Users

- **Service Desk Agents** – Create and update incident records.
- **IT Support Teams** – Handle and resolve incidents.
- **ServiceNow Administrators** – Configure Client Scripts and UI Policies.

1.6 Key Features

Client Script

- Executes JavaScript on the Incident form.
- Can run when the form loads or when a field value changes.
- Dynamically updates form information based on user input.

UI Policy

- Controls field visibility.
- Makes fields mandatory when required.
- Makes fields read-only when necessary.
- Applies conditions automatically on the Incident form.

1.7 Technology / Platform

- **Platform:** ServiceNow
- **Module:** Incident Management
- **Configuration:** Client Script and UI Policy
- **Scripting:** JavaScript
- **Interface:** ServiceNow Incident Form

1.8 Expected Outcome

The Incident form will dynamically respond to user actions and conditions. Required information will be collected correctly, unnecessary fields can be hidden or restricted, and the overall incident-creation process will become more consistent and user-friendly.

1.9 Conclusion

The brainstorming phase identifies the need for better form control in ServiceNow Incident Management. Implementi
