PHASE 3 – PROJECT DESIGN

3.1 System Design

The project is designed to improve the behavior of the ServiceNow Incident form using Client Scripts and UI Policies.

The design consists of:

- Incident Form
- Client Script
- UI Policy
- UI Policy Actions
- Incident Fields
- User Interaction

3.2 Client Script Design

The Client Script is designed to perform client-side actions on the Incident form.

Script Types

Depending on the requirement, the Client Script can be configured as:

- **onLoad** – Executes when the Incident form is opened.
- **onChange** – Executes when the value of a selected field changes.
- **onSubmit** – Executes before the Incident form is submitted.

The appropriate script type will be selected based on the required functionality.

3.3 UI Policy Design

The UI Policy is designed to dynamically control Incident form fields based on specified conditions.

The UI Policy can control:

- **Mandatory** – Makes a field required.
- **Visible** – Shows or hides a field.
- **Read-only** – Prevents users from modifying a field.

3.4 Condition Design

Conditions are defined using Incident form fields such as:

- Category
- Subcategory
- Impact
- Urgency
- Priority
- State

When the specified condition is satisfied, the corresponding Client Script or UI Policy action will be triggered.

3.5 UI Policy Action Design

UI Policy Actions are used to define the behavior of individual fields.

For example:

Field	Possible Action
Category	Mandatory
Subcategory	Mandatory
Description	Mandatory
Priority	Read-only
Additional information	Visible/Hidden

The exact field behavior can be configured according to the project requirement.

3.6 Process Flow

User opens Incident Form
↓
User enters or changes Incident information
↓
Condition is checked
↓
Client Script / UI Policy executes

↓
Field behavior changes
↓
User completes required information
↓
Incident record is submitted

3.7 Interface Design

The existing ServiceNow Incident form will be used as the user interface.

The design focuses on:

- Simple form interaction.
- Clear field requirements.
- Automatic field behavior.
- Easy data entry.
- Consistent Incident information.

3.8 Security and Access Design

Only authorized ServiceNow users should be able to create or modify Incident records according to their assigned roles and permissions.

Client Scripts and UI Policies will control the form behavior without replacing ServiceNow's existing access-control mechanisms.

3.9 Expected Design Outcome

The final design will provide a dynamic and user-friendly Incident form where fields automatically change their behavior based on predefined conditions.

3.10 Conclusion

The project design defines how Client Scripts, UI Policies, conditions, and UI Policy Actions will work together to improve the ServiceNow Incident form. This design will be used during the development and configuration phase.
