PHASE 6 – PROJECT TESTING

6.1 Testing Overview

The testing phase is performed to verify that the Client Script and UI Policy work correctly on the ServiceNow Incident form according to the defined requirements.

6.2 Testing Objectives

The main objectives are:

1. Verify that the Client Script executes correctly.
2. Verify that the UI Policy conditions work properly.
3. Check whether fields become mandatory when required.
4. Check whether fields are displayed or hidden correctly.
5. Check whether fields become read-only when required.
6. Ensure that the Incident form can be submitted successfully.
7. Identify and fix configuration errors.

6.3 Test Cases

Test Case	Test Condition	Expected Result
TC01	Open Incident form	Form loads successfully
TC02	Change the specified field value	Client Script executes correctly
TC03	UI Policy condition becomes true	Configured field behavior is applied

TC04	Mandatory condition is satisfied	Required field becomes mandatory
TC05	Visibility condition is satisfied	Field is displayed/hidden as configured
TC06	Read-only condition is satisfied	Field cannot be edited
TC07	Condition becomes false	Field returns to its normal behavior
TC08	Submit completed Incident	Incident is saved successfully

6.4 Client Script Testing

The Client Script is tested by performing the event for which it was configured, such as **onLoad, onChange, or onSubmit**.

The expected result is compared with the actual behavior of the Incident form.

6.5 UI Policy Testing

The UI Policy is tested using different field values and conditions.

The following behaviors are verified:

- Mandatory field behavior.
- Field visibility.
- Read-only behavior.
- Policy condition execution.
- Reversal of field behavior when the condition is no longer satisfied.

6.6 Integration Testing

Client Script and UI Policy behavior is tested together to ensure that they do not produce conflicting results on the Incident form.

Different Incident scenarios are used to verify the overall functionality.

6.7 Error Identification and Fixing

If the expected behavior does not occur, the configuration is checked for:

- Incorrect conditions.
- Incorrect Client Script type.
- JavaScript errors.
- Incorrect field names.
- Incorrect UI Policy Actions.
- Conflicting Client Scripts or UI Policies.

The identified issues are corrected and the test is performed again.

6.8 Expected Testing Result

The testing should confirm that:

- Client Scripts execute as expected.
- UI Policies apply the correct conditions.
- Fields behave according to the configured rules.
- Required information is collected.
- The Incident form works correctly without unexpected behavior.

6.9 Conclusion

The testing phase verifies the functionality and reliability of the implemented Client Script and UI Policy. Successful testing ensures that the ServiceNow Incident form behaves correctly under different conditions and is ready for documentation and demonstration.
